Percent Enslaved Population in Connecticut, 1790

This map shows the slave population of Connecticut towns in 1790, presented as the enslaved population percentage of each town.

To represent this data visually, I used graduated symbols and colors. Larger symbols and darker values of green allow viewers to easily identify areas with a high enslaved population.

The legend utilizes a color ramp to represent the increasing percentage as the color becomes darker. Below each end of the color ramp is the corresponding symbol size for that color, to provide a reference for the connection between color, size, and percentage value.

I chose to use a black outline for the town boundaries with no basemap, so the data stands out.
